### **SOEN 331:**

# Formal Methods for Software Engineering Various problems with solutions

Dr. Constantinos Constantinides, P.Eng.

Department of Computer Science and Software Engineering Concordia University Montreal, Canada

November 25, 2021

## Part 1: Propositional logic

- You are shown a set of four cards placed on a table, each of which has a **shape** on one side and a **number** on the other side.
- ► The visible faces of the cards show the shapes **rectangle**, and **circle**, and the numbers **4**, and **7**.
- ▶ Which card(s) must you turn over in order to test the truth of the proposition that "If a card has a circle on one side, then it has an odd number on the other side"?

### Problem 1: Solution

- ▶ Recall the arrangement: rectangle, circle, 4, 7.
- First, we summarize the proposition as circle → odd.
- By Modus Ponens we must turn circle and expect an odd number.

$$p \rightarrow q, p, \therefore q$$

▶ By Modus Tollens we must turn **4** and expect a non-circle.

$$p \rightarrow q, \neg q, \therefore \neg p$$

- Recall the arrangement: rectangle, circle, 4, 7.
- ▶ Recall the proposition: circle → odd.
- It would be wrong to select square and expect an even number. This is an invalidating pattern called "inverse error."

$$p \rightarrow q, \neg p, \therefore \neg q$$

▶ It would also be wrong to select **7** and expect a circle. This is an invalidating pattern called "converse error."

$$p \rightarrow q, q, \therefore p$$

- "If every prime number is a multiple of 4, and every multiple of 4 is an even number, then every prime number is even."
- ▶ Is this an argument? Is it valid? Is it sound?

### Problem 2: Solution

- "If every prime number is a multiple of 4, and every multiple of 4 is an even number, then every prime number is even."
- ► This is a valid argument form called "hypothetical syllogism" (or "transitivity").
- ▶ Formally this is expressed as  $p \rightarrow q, q \rightarrow r$  ∴  $p \rightarrow r$ .
- ▶ It is not sound since not all premises are true.

▶ In a paper titled "Computing Machinery and Intelligence" published in 1950, **Alan Turing** wrote:

"If each man had a definite set of rules of conduct by which he regulated his life he would be no better than a machine. But there are no such rules, so men cannot be machines."

Is this a valid argument?

### Problem 3: Solution

- ▶ Premise If each man had a definite set of rules of conduct by which he regulated his life, [Then] he would be no better than a machine.  $(p \rightarrow q)$
- ▶ Premise There is no set of rules of conduct.  $(\neg p)$
- ▶ Conclusion Therefore, men cannot be machines.  $(\neg q)$
- This is a non-validating pattern called "Denying the antecedent" (or "inverse error").
- ► In the article, Turing actually states that this is an example of an invalid argument.

### Part 2: Predicate logic

- Let p(x) denote the statement "x is a politician", and q(x) denote the statement "x is crooked." Formalize the following sentences:
- There is an honest politician.
- No politician is honest.
- All politicians are honest.
- No politician is crooked.
- Some politicians are crooked.

### Problem 1: Solution

- Let p(x) denote the statement "x is a politician", and q(x) denote the statement "x is crooked." Formalize the following sentences:
- ▶ There is an honest politician:  $\exists x (p(x) \land \neg q(x))$ .
- ▶ No politician is honest:  $\forall x(p(x) \rightarrow q(x))$ .
- ▶ All politicians are honest:  $\forall x(p(x) \rightarrow \neg q(x))$ .
- ▶ No politician is crooked:  $\forall x(p(x) \rightarrow \neg q(x))$ .
- ▶ Some politicians are crooked:  $\exists x(p(x) \land q(x))$ .

- ► Consider the sentence "All that glitters is gold."
- ► Translate the predicate in formal logic for predicates glitters(x) meaning "x glitters" and gold(x) meaning "x is gold."

### Problem 2: Solution

Translate the predicate in formal logic for predicates glitters(x) meaning "x glitters" and gold(x) meaning "x is gold."

$$\forall x(glitters(x) \rightarrow gold(x))$$

Use the two predicates glitters(x) and gold(x) to build the 4 types of categorical propositions in formal logic, clearly indicating each form.

### Problem 3: Solution

Use the two predicates glitters(x) and gold(x) to build the 4 types of categorical propositions in formal logic, clearly indicating each form.

- A  $\forall x (glitters(x) \rightarrow gold(x))$
- $\mathsf{E} \ \forall \, x \, (\mathit{glitters}(x) \to \neg \mathit{gold}(x))$
- $\exists x (glitters(x) \land gold(x))$
- $\bigcirc \exists x (glitters(x) \land \neg gold(x))$

- Given the sentence: The city is now empty / No human soul remains.
- ▶ We can identify two predicates soul(x) that reads "x is human soul" and remains(x) which reads "x remains."
- Build categorical propositions in English, identify their forms, and translate them into formal logic.

### Problem 4: Solution

A All human souls remain.  $\forall x (soul(x) \rightarrow remains(x)).$ 

E No human souls remain.  $\forall x (soul(x) \rightarrow \neg remains(x))$ 

- I Some human souls remain.  $\exists x (soul(x) \land remains(x))$
- O Some human souls do not remain.  $\exists x (soul(x) \land \neg remains(x))$

From the previous problem, identify pairs that are

- contradictories,
- contraries,
- subcontraries, and
- pairs that support subalteration.

### Problem 5: Solution

#### Contradictories:

- "All human souls remain" and "Some human souls do not remain."
- "No human souls remain" and "Some human souls remain."

#### Contraries:

"All human souls remain" and "No human souls remain."

#### Subontraries:

"Some human souls remain" and "Some human souls do not remain."

#### Subalteration:

- "Some human souls remain" is a subaltern to "All human souls remain."
- "Some human souls do not remain" is a subaltern to "No human souls remain."

### Part 3: Binary relations

The binary relation "is reachable from" on the set of nodes of a directed mathematical multigraph, can be best described as follows:

Reflexive?

Irreflexive?

Symmetric?

Asymmetric?

**Antisymmetric?** 

Transitive?

### Problem 1: Solution

The binary relation "is reachable from" on the set of nodes of a directed mathematical multigraph, can be best described as follows:

Reflexive	$\forall a \in A : aRa$	<b>√</b>
Irreflexive	$\forall \ a \in A : \neg(aRa)$	×
Symmetric	$orall  a,b \in A: aRb  ightarrow bRa$	×
Asymmetric	$orall  a,b \in A: aRb  ightarrow  eg bRa$	×
Antisymmetric	$\forall a,b,c \in A: (aRb \land bRa) \rightarrow a = b$	×
Transitive	$\forall a,b,c \in A: (aRb \land bRc) \rightarrow aRc$	✓

- Consider the binary relation "x divides y" on the set of natural numbers.
- Discuss reflexivity, symmetry, antisymmetry and transitivity.

### Problem 2: Solution

- Consider the binary relation "x divides y" on the set of natural numbers.
- ▶ **Reflexivity** is defined as  $\forall$  *a* ∈ *A* : *aRa*.
- Since x is always a divisor of itself, the relation is reflexive.
- ▶ **Symmetry** is defined as  $\forall a, b \in A : aRb \rightarrow bRa$ .
- ► The relation is not symmetric since not for every x being a divisor of y it is also the case that y is also a divisor of x.

- ► Consider the binary relation "x divides y" on the set of natural numbers.
- ▶ **Transitivity** is defined as  $\forall a, b, c \in A : (aRb \land bRc) \rightarrow aRc$ .
- ► The relation is transitive since if x is a divisor of y and if y is a divisor of z, then x is also a divisor of z.

- ▶ If *R* is the relation "is sister of" and *S* is the relation "is the mother of" on the set of all people, describe the relations
- $\triangleright$   $R \circ S$ , and
- $\triangleright$   $S \circ S$ .

### Problem 3: Solution

- ▶ R: "is sister of", and S: "is the mother of" on the set of all people.
- ▶ Recall that for  $R \subseteq X \times Y$ , and  $S \subseteq Y \times Z$ , then

$$R \circ S = \{(x, z) \in X \times Z \mid (\exists y \in Y : (x, y) \in R \land (y, z) \in S\}$$

- R ∘ S: If a is the sister of b, and b is the mother of c, then a is a sister of the mother of c. In other words, a is an aunt of c. Thus, R ∘ S captures the relation "is an aunt of."
- ▶  $S \circ S$  captures the relation "is a grandmother of."

Let  $A = \{0, 1, 2, 3\}$  and relation R over A defined as follows:

$$R = \{(0,0), (0,1), (0,3), (1,0), (1,1), (2,2), (3,0), (3,3)\}$$

▶ Is R an equivalence relation, a partial order, or neither?

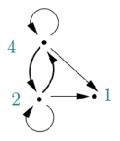

### Problem 4: Solution

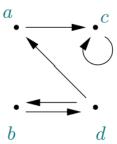

Let  $A = \{0, 1, 2, 3\}$  and a relation R over A to be defined as follows:

$$R = \{(0,0), (0,1), (0,3), (1,0), (1,1), (2,2), (3,0), (3,3)\}$$

- ▶ The relation is reflexive, symmetric and not transitive.
- lt is, thus, neither an equivalence relation, nor a partial order.

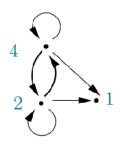

► For each of the relations shown below, list its ordered pairs and determine all their properties.

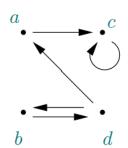

### Problem 5: Solution

For the relations shown below

- ► The ordered pairs are
  - $1. \ \{(2,1),(2,2),(2,4),(4,1),(4,2),(4,4)\}$
  - 2.  $\{(a,c),(b,d),(c,c),(d,a),(d,b)\}$

		(a)	(b)
Reflexive	$\forall a \in A : aRa$	×	×
Irreflexive	$\forall a \in A : \neg(aRa)$	×	×
Symmetric	$\forall  a,b \in A: aRb  ightarrow bRa$	×	×
Asymmetric	$\forall \ a,b \in A: aRb  ightarrow  eg bRa$	×	×
Antisymmetric	$\forall a,b,c \in A: (aRb \land bRa) \rightarrow a = b$	×	×
Transitive	$\forall a,b,c \in A: (aRb \land bRc) \rightarrow aRc$	<b>√</b>	×

## Part 4: Functions

▶ Given sets  $A = \{a, b, c\}$ , and  $B = \{1, 2, 3\}$  decide which of the functions is injective, surjective or bijective.

### Problem 1: Solution

- ▶ Given sets  $A = \{a, b, c\}$ , and  $B = \{1, 2, 3\}$  decide which of the functions is injective, surjective or bijective.
- ▶  $\{a \mapsto 1, b \mapsto 1, c \mapsto 3\}$ : Not injective since the value 1 is repeated. Not surjective since the element 2 in the codomain is not a value of the function.
- ▶  $\{a \mapsto 1, b \mapsto 3, c \mapsto 2\}$ : Injective since values are not repeated and surjective since the range and codomain coincide. By definition it is also bijective.

▶ Given sets  $A = \{a, b, c\}$ , and  $B = \{1, 2\}$  decide whether the following function is injective, surjective or bijective.

### Problem 2: Solution

- ▶ Given sets  $A = \{a, b, c\}$ , and  $B = \{1, 2\}$  decide whether the following function is injective, surjective or bijective.
- ▶  $\{a \mapsto 1, b \mapsto 1, c \mapsto 2\}$ : Not injective since the value 1 is repeated. It is surjective since the range and the codomain are the same.

▶ Given sets  $A = \{a, b\}$ , and  $B = \{1, 2, 3\}$  decide whether the following function is injective, surjective or bijective.

$$a \mapsto 3, b \mapsto 1$$

### Problem 3: Solution

- ▶ Given sets  $A = \{a, b\}$ , and  $B = \{1, 2, 3\}$  decide whether the following function is injective, surjective or bijective.
- ▶  $\{a \mapsto 3, b \mapsto 1\}$ : Injective but not surjective.

- Given Odd and Even that represent the sets of odd and even natural numbers respectively.
- ▶ Consider function  $f: Odd \rightarrow Even$  defined by f(x) = x 1.
- ▶ Is *f* injective, surjective, bijective?
- Does there exist an inverse function?

## Problem 4: Solution

- ▶ The function f(x) = x 1 is a bijection.
- ▶ Its inverse function is  $f^{-1} = x + 1$ .

# Functions problems 5 - 9

The following applies to Problems 5 - 9.

Binary relations are sets of pairs and can model lookup tables.

```
Employees: NAME \leftrightarrow Phone
Employees = \{ (frank \mapsto 0110), (philip \mapsto 0113), (aki \mapsto 4019), (doug \mapsto 4107), \dots \}
```

What is the result of

 $\{frank, doug\} \lhd Employees =$ 

### Problem 5: Solution

Domain restriction selects pairs based on their first element:

```
 \begin{cases} \textit{frank}, \textit{doug} \} \lhd \textit{Employees} = \\ \{ & (\textit{doug} \mapsto 4107), \\ & (\textit{frank} \mapsto 0110) \\ \} \end{cases}
```

What is the result of

 $\textit{Employees} \rhd \{4000..4999\} =$ 

### Problem 6: Solution

Range restriction selects pairs based on their second element:

```
Employees \rhd \{4000..4999\} = \{ \\ (aki \mapsto 4019), \\ (doug \mapsto 4107) \\ \}
```

What is the result of

$$Employees' = Employees \oplus \{frank \mapsto 0178\} =$$

## Problem 7: Solution

Overriding can model database updates:

```
Employees' = Employees \oplus \{frank \mapsto 0178\} = \{ \\ (frank \mapsto 0178), \\ (philip \mapsto 0113), \\ (aki \mapsto 4019), \\ (doug \mapsto 4107), \\ \dots \\ \}
```

What is the result of

$$Employees' = \{frank\} \lhd Employees =$$

## Problem 8: Solution

The domain subtraction of a function or binary relation R by a set A, denoted as

$$A \triangleleft R$$

removes all elements of A from the domain of the function:

```
Employees' = \{frank\} \lessdot Employees = \{ \\ (philip \mapsto 0113), \\ (aki \mapsto 4019), \\ (doug \mapsto 4107), \\ \dots \\ \}
```

What is the result of

$$\textit{Employees}' = \textit{Employees} \rhd \{4107\} =$$

### Problem 9: Solution

The range subtraction of a function of binary relation R by a set B, denoted as

$$R \triangleright B$$

removes all elements of B from the codomain of the function:

```
Employees' = Employees \Rightarrow \{4107\} = \{ (philip \mapsto 0113), (aki \mapsto 4019), \dots \}
```

# Part 5: Temporal logic

Translate the following formula into English:

 $\exists x : Person \mid (philosopher(x) \land \Diamond king(x))$ 

### Problem 1: Solution

Translate the following formula into English:

$$\exists x : Person \mid (philosopher(x) \land \Diamond king(x))$$

The formula translates to:

"There is someone who is now a philosopher and will be a king at some time."

Translate the following formula into English:

 $\exists x : Person \mid \Diamond(philosopher(x) \land king(x))$ 

### Problem 2: Solution

Translate the following formula into English:

$$\exists x : Person \mid \Diamond(philosopher(x) \land king(x))$$

The formula translates to:

"There now exists someone who will at some time be both a philosopher and a king."

For a routine S, express the partial correctness triple in linear temporal logic.

### Problem 3: Solution

The triple reads

and it can be expressed in LTL as

$$P \rightarrow \Box(halts(S) \rightarrow Q)$$

which reads:

"If P holds at the initial state, then it is always the case that whenever S halts, then Q holds." (i.e. if the routine halts at any moment in time, then the postcondition will hold).

Describe and visualize the following formula:

 $\Box(\phi \land \bigcirc \psi)$ 

### Problem 4: Solution

 $\Box(\phi \land \bigcirc \psi)$ 

 $(\phi \land \bigcirc \psi)$  is globally true:

 $\phi$  is true at every moment and  $\psi$  is also true at every next moment.

Describe and visualize the following formula:

$$\phi \mathcal{U} (\phi \mathcal{U} \psi)$$

### Problem 5: Solution

## $\phi \mathcal{U} (\phi \mathcal{U} \psi)$

- $\phi$  is true up and until (but not including) the moment when  $(\phi \mathcal{U} \psi)$  becomes true.
- ▶ The parenthesized formula reads:  $\phi$  is true up and until (but not including) the moment when  $\psi$  becomes true.

Describe and visualize the following formula:

$$\phi \wedge \bigcirc (\psi \mathcal{U} (\psi \mathcal{U} \tau))$$

### Problem 6: Solution

$$\phi \wedge \bigcirc (\psi \mathcal{U} (\psi \mathcal{U} \tau))$$

- ▶ Both  $\phi$  and  $\bigcirc(\psi \mathcal{U}(\psi \mathcal{U}\tau))$  are true at time i.
- $(\psi \mathcal{U} (\psi \mathcal{U} \tau))$  is true at time i+1:  $\psi$  is true up and until (but not including) the moment when  $(\psi \mathcal{U} \tau)$  becomes true.

## Problem 7: Solution

$$\Box(\phi \lor \psi)$$

The parenthesized formula is globally true (i.e. at every moment).

## Problem 8: Solution

$$\bigcirc \Box (\phi \oplus \psi)$$

The entire formula is true at time i.

This means that  $\Box(\phi \oplus \psi)$  is true at time i+1.

The parenthesized formula becomes true at time i+1 and remains true subsequently.

## Problem 9: Solution

Is the formula well-formed?

Yes, because it is interpreted as  $\bigcirc^2(\Diamond(\Box(\phi)))$ .

or

 $\bigcirc^2$ (formula).

# Problem 9: Solution /cont.

$$\bigcirc^2 \Diamond \Box \phi$$

The entire formula is true at time i.

This means that  $\Diamond \Box \phi$  is true at time i+2.

This implies that at some moment in time starting from i+2,  $\phi$  becomes true and stays true subsequently.

## Problem 10: Solution

The entire formula is true at time = i.

The formula is interpreted as "It is not the case that at some moment in time  $\phi$  becomes true and stays true subsequently."

The interpretation can be rephrased as "Once  $\phi$  becomes true, it will not remain true for ever."

Translate the following requirements into temporal logic expressions:

- 1. Once a request is made, it will remain registered at least until the request is answered.
- 2. Once a process requests a resource, it will be inactive until it receives a go message.

#### Problem 11: Solution

Translate the following requirements into temporal logic expressions:

1. Once a request is made, it will remain registered at least until the request is answered.

```
\Box(\textit{request\_made} \rightarrow (\textit{request\_registered} \ \mathcal{U} \ \textit{request\_answered}))
```

2. Once a process requests a resource, it will be inactive until it receives a go message.

```
\Box(sent(request) \rightarrow (inactive(P)U received(go)))
```

Consider the following requirements for a library system:

- 1. Administrators operate in self-exclusion for a write operation, i.e. only one administrator may be modifying the library catalog at any moment in time:
- 2. Administrators and clients operate in mutual exclusion:

#### Problem 12: Solution

1. Administrators operate in self-exclusion for a write operation, i.e. only one administrator may be modifying the library catalog at any moment in time:

```
\forall i, j : Administrator (\Box \neg (modification(admin_i) \land modification(admin_j))) for i \neq j.
```

2. Administrators and clients operate in mutual exclusion:

```
\Box(\neg active(admin) \lor \neg active(client))
```

In the previous example (for requirement 2), would

 $\Box(active(admin) \oplus active(client))$ 

be a correct expression to capture mutual exclusion?

### Problem 13: Solution

No, because this would enforce that always one must be active, whereas we need to allow the possibility for a moment in time that none is active.

Translate the following into formal logic:

"Once red, the light cannot become green immediately."

### Problem 14: Solution

Translate the following into formal logic:

"Once red, the light cannot become green immediately."

 $\Box(\textit{red} \rightarrow \neg \bigcirc \textit{green})$ 

Translate the following into formal logic:

"Once red, the light always becomes green eventually after being yellow for some time."

(Hint: Enforce some duration for both red and yellow before reaching green.)

### Problem 15: Solution

Translate the following into formal logic:

"Once red, the light always becomes green eventually after being yellow for some time."

$$\Box(\textit{red} \rightarrow \bigcirc(\textit{red}\,\mathcal{U}\,(\textit{yellow}\,\wedge\bigcirc(\textit{yellow}\,\mathcal{U}\,\textit{green}))))$$

Given the following statements that constitute system requirements:

- 1.  $\Box$ (request  $\rightarrow \Diamond$ acknowledgment)
- $2. \ \Box (\textit{acknowledgment} \rightarrow \bigcirc \textit{processing})$
- 3.  $\Box$ (processing →  $\Diamond \Box$ done)

How would you translate the following statement in English

 $\Box$  request  $\land \Box \neg$  done

and what can you infer about it?

### Problem 16: Solution

The statement translates to "The system continuously sends a request but never sees it completed" and it is inconsistent with the set of requirements.

Translate the following into formal statements and indicate the corresponding property (fairness, liveness, safety):

- "Printing for processes a and b can never occur simultaneously."
- "Eventually, printing will be allowed for some process."
- "If a process makes a print request infinitely often, then printing for that process will occur infinitely often."

### Problem 17: Solution

► (Safety) "Printing for processes a and b can never occur simultaneously."

```
\Box \neg (printing(a) \land printing(b))
```

► (Liveness) "Eventually, printing will be allowed for some process."

```
\Diamond(\exists x : Process \mid printing(x))
```

► (Fairness) "If a process makes a print request infinitely often, then printing for that process will occur infinitely often."

```
\forall y : Process (\Box \Diamond print\_request(y) \rightarrow \Box \Diamond printing(y))
```

Let p and q be propositions. The expression  $p \to \Diamond q$  maps to which property below:

Guarantee	Response	Precedence

## Problem 18: Solution

Let p and q be propositions. The expression  $p \to \Diamond q$  maps to which property below:

Guarantee	Response	Precedence
×	✓	×

	Safety	Liveness	Fairness
"Once red, the light will never			
become immediately green"			

# Problem 19: Solution

	Safety	Liveness	Fairness
"Once red, the light will never	<b>√</b>	×	×
become immediately green"			

	Safety	Liveness	Fairness
"If the light is red infinitely often, it should be yellow infinitely often."			

# Problem 20: Solution

	Safety	Liveness	Fairness
"If the light is red infinitely often, it should be yellow infinitely often."	×	×	✓

	Safety	Liveness	Fairness
"Once red, the light becomes green eventually."			

# Problem 21: Solution

	Safety	Liveness	Fairness
"Once red, the light becomes green eventually."	×	<b>√</b>	×

	Safety	Liveness	Fairness
"The resource must not be simultaneously accessed by a writer and a reader."			

# Problem 22: Solution

	Safety	Liveness	Fairness
"The resource must not be simultaneously accessed by a writer and a reader."	✓	×	×

Select the appropriate temporal logic formula for "The boiler controller system is deadlock free."

□◇¬deadlock	<i> </i>	□¬deadlock	<i><b>♦□¬deadlock</b></i>

### Problem 23: Solution

Select the appropriate temporal logic formula for "The boiler controller system is deadlock free."

□◇¬deadlock	<i> </i>	□¬deadlock	<i><b>♦□¬deadlock</b></i>
×	×	✓	×

What pattern of behavior does the following temporal formula specify?

$$egin{aligned} \mathbf{start} &
ightarrow req\_jack \ \mathbf{start} &
ightarrow \neg wait \ req\_jack &
ightarrow igtarrow \neg req\_jack \ wait &
ightarrow igtarrow req\_jack \ wait &
ightarrow igtarrow \neg wait \ \end{aligned}$$

## Problem 24: Solution

The program reproduces indefinitely the sequence

$$\langle (req\_jack \land \neg wait), (\neg req\_jack \land wait) \rangle$$

# Part 6: Algebraic specifications

For the Set ADT whose operations are shown below

```
\begin{array}{l} \mathsf{newset} \to \mathsf{Set}; \\ \mathsf{add} : \mathsf{Set} \times \mathsf{Element} \to \mathsf{Set}; \\ \mathsf{remove} : \mathsf{Set} \times \mathsf{Element} \to \mathsf{Set}; \\ \mathsf{size} : \mathsf{Set} \to \mathbb{N}_0; \\ \mathsf{isempty} : \mathsf{Set} \to \mathsf{Boolean}; \\ \mathsf{ismember} : \mathsf{Set} \times \mathsf{Element} \to \mathsf{Boolean}; \end{array}
```

- and for variables s: Set; x, y: Element, produce axioms to demonstrate the following properties of operation add:
- 1 Commutativity, and
- 2 Idempotence.

# Problem 1 /cont.

- ► **Commutativity** is a property of a binary operation whereby changing the order of the operands does not change the result.
- ▶ **Idempotence** is the property of certain operations whereby they can be applied multiple times without changing the result beyond the initial application.

#### Problem 1: Solution

For the Set ADT

```
newset \rightarrow Set;
add : Set \times Element \rightarrow Set;
remove : Set \times Element \rightarrow Set;
size : Set \rightarrow \mathbb{N}_0;
isempty : Set \rightarrow Boolean;
ismember : Set \times Element \rightarrow Boolean;
```

- The commutativity property of operation add can be captured by add(add(s, x), y) = add(add(s, y), x);
- → and its idempotence property can be captured by add(add(s, x), x) = add(s, x);
