Introduction to Data Visualization in Python

How to make graphs using Matplotlib, Pandas and Seaborn

Figure 1: Photo by <u>Lukas Blazek</u> on <u>Unsplash</u>

Data visualization is the discipline of trying to understand data by placing it in a visual

Get started

Python offers multiple great graphing libraries that come packed with lots of different features. No matter if you want to create interactive, live or highly customized plots python has an excellent library for you.

To get a little overview here are a few popular plotting libraries:

- Matplotlib: low level, provides lots of freedom
- Pandas Visualization: easy to use interface, built on Matplotlib
- Seaborn: high-level interface, great default styles
- ggplot: based on R's ggplot2, uses Grammar of Graphics
- Plotly: can create interactive plots

In this article, we will learn how to create basic plots using Matplotlib, Pandas visualization and Seaborn as well as how to use some specific features of each library. This article will focus on the syntax and not on interpreting the graphs, which I will cover in another blog post.

In further articles, I will go over interactive plotting tools like Plotly, which is built on D3 and can also be used with JavaScript.

Importing Datasets

In this article, we will use two datasets which are freely available. The <u>Iris</u> and <u>Wine</u> <u>Reviews</u> dataset, which we can both load in using pandas <code>read_csv</code> method.

Get started

	sepal_length	sepal_width	petal_length	petal_width	class
0	5.1	3.5	1.4	0.2	Iris-setosa
1	4.9	3.0	1.4	0.2	Iris-setosa
2	4.7	3.2	1.3	0.2	Iris-setosa
3	4.6	3.1	1.5	0.2	Iris-setosa
4	5.0	3.6	1.4	0.2	Iris-setosa

Get started

Matplotlib

Matplotlib is the most popular python plotting library. It is a low-level library with a Matlab like interface which offers lots of freedom at the cost of having to write more code.

To install Matplotlib pip and conda can be used.

```
pip install matplotlib
or
conda install matplotlib
```

Matplotlib is specifically good for creating basic graphs like line charts, bar charts, histograms and many more. It can be imported by typing:

```
import matplotlib.pyplot as plt
```

Scatter Plot

To create a scatter plot in Matplotlib we can use the scatter method. We will also create a figure and an axis using plt.subplots so we can give our plot a title and labels.

Get started

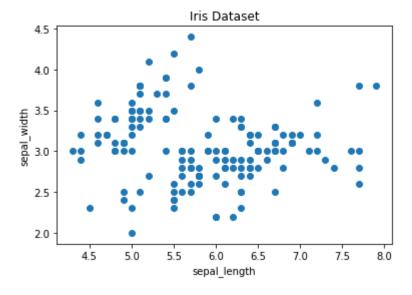

Figure 4: Matplotlib Scatter plot

We can give the graph more meaning by coloring in each data-point by its class. This can be done by creating a dictionary which maps from class to color and then scattering each point on its own using a for-loop and passing the respective color.

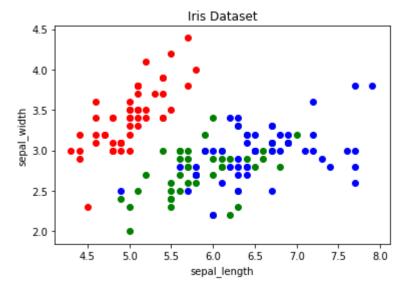

Get started

Cierro E. Caettor Diet colored by alex

Get started

multiple columns in one graph, by looping through the columns we want and plotting each column on the same axis.

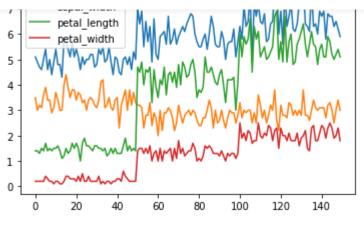

Figure 6: Line Chart

Histogram

In Matplotlib we can create a Histogram using the hist method. If we pass it categorical data like the points column from the wine-review dataset it will automatically calculate how often each class occurs.

Get started

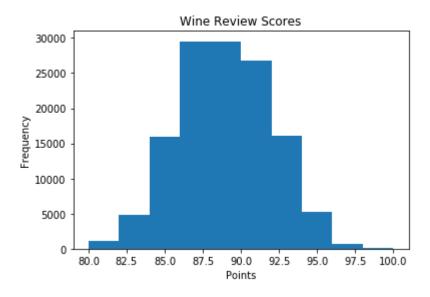

Figure 7: Histogram

Bar Chart

A bar chart can be created using the <code>bar</code> method. The bar-chart isn't automatically calculating the frequency of a category so we are going to use pandas <code>value_counts</code> function to do this. The bar-chart is useful for categorical data that doesn't have a lot of different categories (less than 30) because else it can get quite messy.

Get started

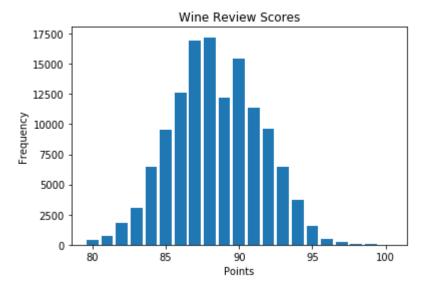

Figure 8: Bar-Chart

Pandas Visualization

Get started

will use in this article.

Pandas Visualization makes it really easy to create plots out of a pandas dataframe and series. It also has a higher level API than Matplotlib and therefore we need less code for the same results.

Pandas can be installed using either pip or conda.

```
pip install pandas
or
conda install pandas
```

Scatter Plot

To create a scatter plot in Pandas we can call <dataset>.plot.scatter() and pass it two arguments, the name of the x-column as well as the name of the y-column. Optionally we can also pass it a title.

Get started

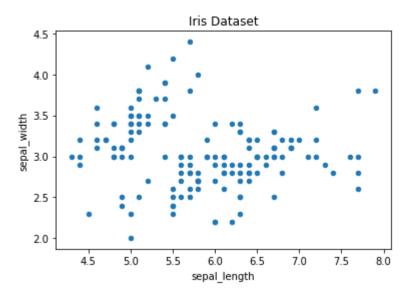

Figure 9: Scatter Plot

As you can see in the image it is automatically setting the x and y label to the column names.

Line Chart

To create a line-chart in Pandas we can call <dataframe>.plot.line() . Whilst in Matplotlib we needed to loop-through each column we wanted to plot, in Pandas we don't need to do this because it automatically plots all available numeric columns (at least if we don't specify a specific column/s).

Get started

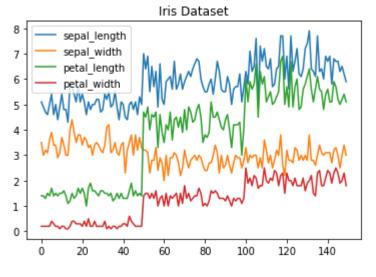

Figure 10: Line Chart

Get started

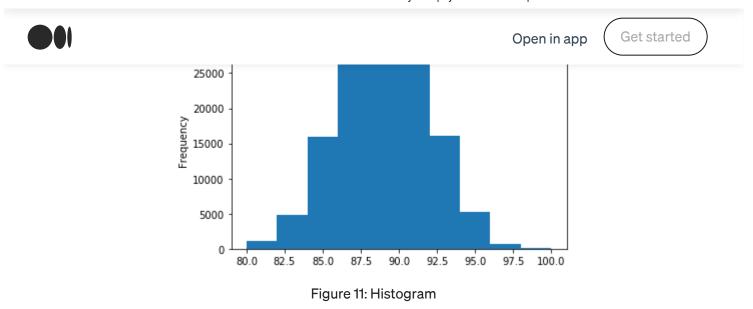

Histogram

In Pandas, we can create a Histogram with the plot.hist method. There aren't any required arguments but we can optionally pass some like the bin size.

It's also really easy to create multiple histograms.

Get started

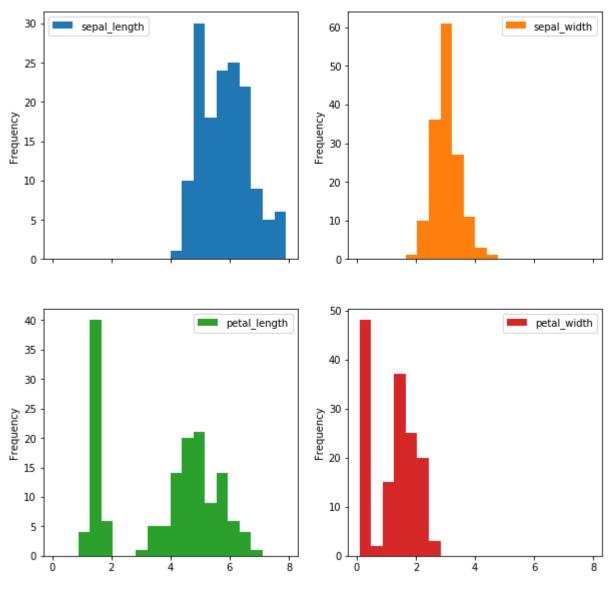

Figure 12: Multiple Histograms

The subplots argument specifies that we want a separate plot for each feature and the layout specifies the number of plots per row and column.

Bar Chart

To plot a bar-chart we can use the plot.bar() method, but before we can call this we

and to get and date. For this we will first count the accommons wing the

Get started

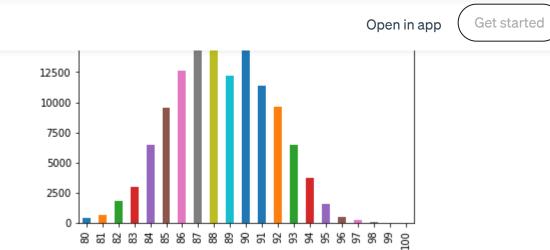

Figure 13: Vertical Bar-Chart

It's also really simple to make a horizontal bar-chart using the plot.barh() method.

Get started

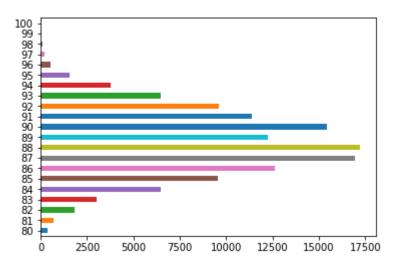

Figure 14: Horizontal Bar-Chart

We can also plot other data then the number of occurrences.

Get started

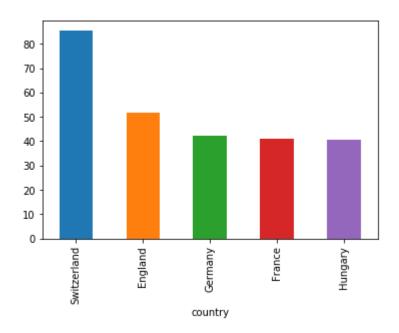

Figure 15: Countries with the most expensive wine(on average)

In the example above we grouped the data by country and then took the mean of the wine prices, ordered it, and plotted the 5 countries with the highest average wine price.

Seaborn

Seaborn is a Python data visualization library based on Matplotlib. It provides a high-level interface for creating attractive graphs.

Seaborn has a lot to offer. You can create graphs in one line that would take you

Get started

It can be imported by typing:

import seaborn as sns

Scatter plot

We can use the .scatterplot method for creating a scatterplot, and just as in Pandas we need to pass it the column names of the x and y data, but now we also need to pass the data as an additional argument because we aren't calling the function on the data directly as we did in Pandas.

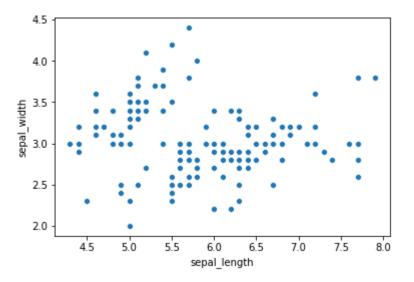

Figure 16: Scatterplot

We can also highlight the points by class using the hue argument, which is a lot easier than in Matplotlib.

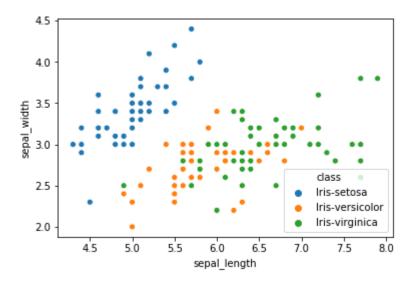

Figure 17: Scatterplot colored by class

Line chart

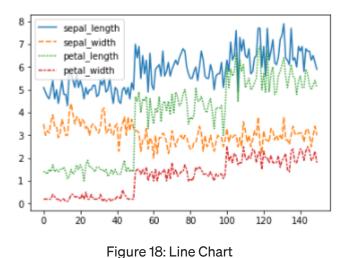

To create a line-chart the sns.lineplot method can be used. The only required argument is the data, which in our case are the four numeric columns from the Iris dataset. We could also use the sns.kdeplot method which rounds of the edges of the curves and therefore is cleaner if you have a lot of outliers in your dataset.

Get started

Histogram

To create a histogram in Seaborn we use the <code>sns.distplot</code> method. We need to pass it the column we want to plot and it will calculate the occurrences itself. We can also pass

Get started

Bar chart

In Seaborn a bar-chart can be created using the sns.countplot method and passing it the data.

Get started

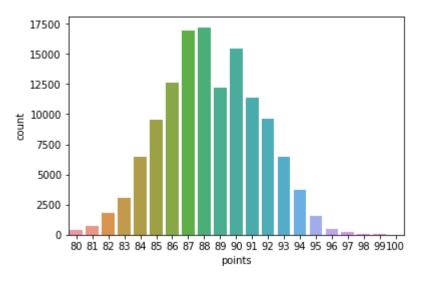

Figure 21: Bar-Chart

Other graphs

Now that you have a basic understanding of the Matplotlib, Pandas Visualization and Seaborn syntax I want to show you a few other graph types that are useful for extracting insides.

For most of them, Seaborn is the go-to library because of its high-level interface that allows for the creation of beautiful graphs in just a few lines of code.

Box plots

A Box Plot is a graphical method of displaying the <u>five-number summary</u>. We can create box plots using seaborns sns.boxplot method and passing it the data as well as

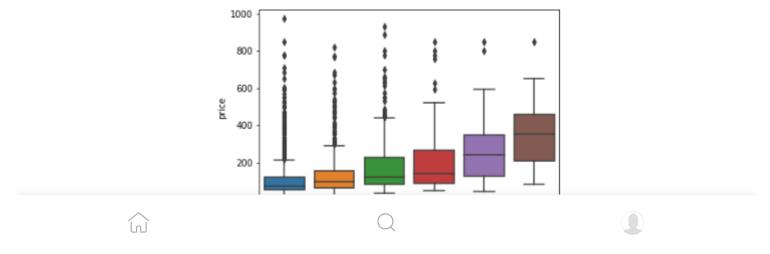

Get started

Get started

Box Plots, just like bar-charts are great for data with only a few categories but can get messy really quickly.

Heatmap

A Heatmap is a graphical representation of data where the individual values contained in a <u>matrix</u> are represented as colors. Heatmaps are perfect for exploring the correlation of features in a dataset.

To get the correlation of the features inside a dataset we can call <dataset>.corr(), which is a Pandas dataframe method. This will give us the correlation matrix.

We can now use either Matplotlib or Seaborn to create the heatmap.

Matplotlib:

Get started

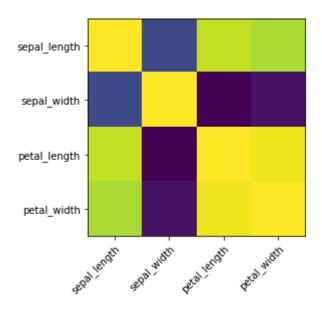

Figure 23: Heatmap without annotations

To add annotations to the heatmap we need to add two for loops:

Get started

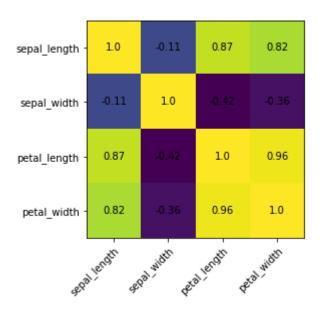

Figure 24: Heatmap with annotations

Seaborn makes it way easier to create a heatmap and add annotations:

Get started

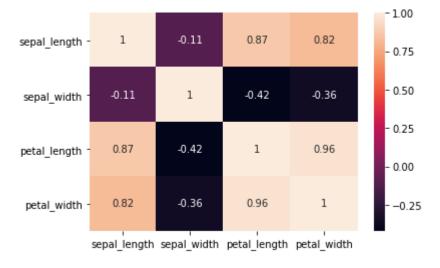

Figure 25: Heatmap with annotations

Faceting

Faceting is the act of breaking data variables up across multiple subplots and combining those subplots into a single figure.

Get started

used to split the data. Then we need to call the map function on our FacetGrid object and define the plot type we want to use, as well as the column we want to graph.

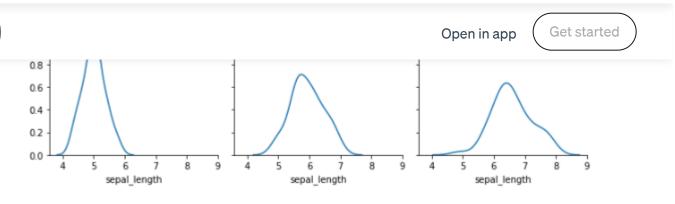

Figure 26: Facet-plot

You can make plots a lot bigger and more complicated than the example above. You can find a few examples <u>here</u>.

Pairplot

Lastly, I will show you Seaborns pairplot and Pandas scatter_matrix , which enable you to plot a grid of pairwise relationships in a dataset.

Get started

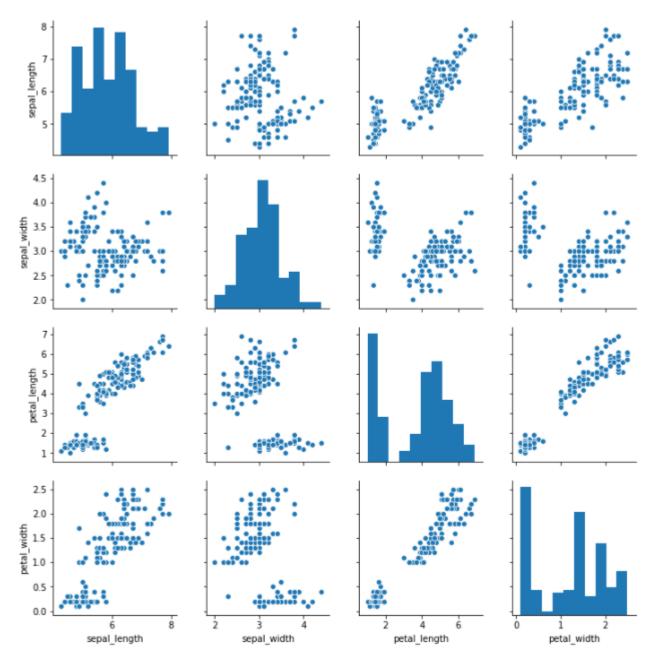

Figure 27: Pairplot

Get started

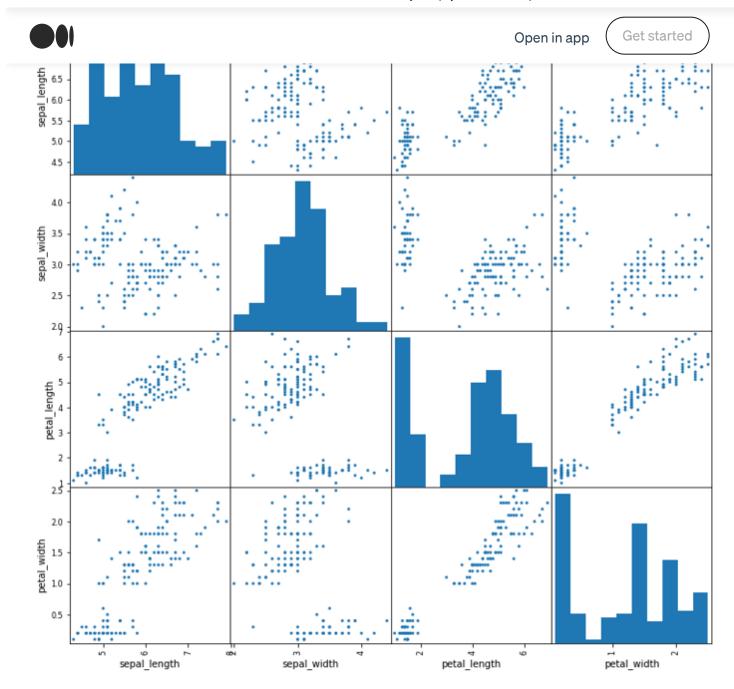

Figure 28: Scatter matrix

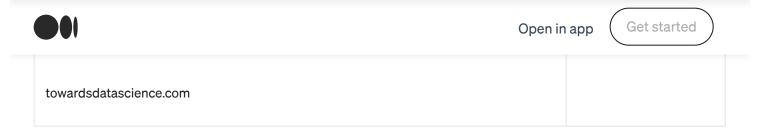

As you can see in the images above these techniques are always plotting two features with each other. The diagonal of the graph is filled with histograms and the other plots are scatter plots.

Recommended Reading

Conclusion

Data visualization is the discipline of trying to understand data by placing it in a visual context so that patterns, trends and correlations that might not otherwise be detected can be exposed.

Python offers multiple great graphing libraries that come packed with lots of different features. In this article, we looked at Matplotlib, Pandas visualization and Seaborn.
